-1- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other

Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and proliferation of myoblasts. It also stimulates

-!- FUNCTION: Plays an important role in growth control. Its major role in stimulating hody growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myobiasts. It also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seeburg P.H., Shine J., Martial J.A., Haxler J.D., Goodman H.M.;

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A_Geneseq_19Jun01:•

DNA sequences encoding insulin precursors of formula 8-99 A, where B and A represent B- and A-chains of insulin respectively, and Pq represents a modified C-peptide or any number of amino acids comprising at least one qipycosylation consensus site, can be inserted into expression vectors which it turn can be used to transform fungal host cells. The fundal ocils are then cultured and the insulin expressed in sect cells on the narvescel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a human insulin precursor comprising insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric proteins containing human growth hormone tragment, used particularly for the production of human insulin
                                                                                                                                    DNA encoding human insulin precursors - which compiles B- and A-chains linked via amino acid chain contq. 1 or more glycosylation sites, for prepn. of insulin in tungal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Insulin, precursor, growth hormone, chaperone, intramulecular, folding, conformation, chimeric protein, chavable, recombinant,

precursor can be a component of chimeric proteins which additionally contains an Verminal fragment of chimeric proteins which additionally contains an Neterinal fragment of chimeric protein which additionally contains an Neterinal fragment of him grammone (Malh) and a cleavable peptide linker (AMY4287). The McH portion of the chimeric protein acts as an intramolecular chapero. (IMC) for the insulin of protein acts as an intramolecular chapero. (IMC) for the insulin of protein acts as an intramolecular chapero. (IMC) for the insulin contains a cleaminal Arg residue which enables the MGH portion of the commerciant human insulin via an MGH-proinsulin chimeric protein can provide human insulin via the MGH-proinsulin protein a higher yield of lower necessary procedural steps, and hence resulting in a higher yield of muman insulin with correctly linked cysteine bridges with fower necessary procedural steps, and hence resulting in a higher yield of Imman insulin with the IMC sequences not only protect insulin sequences from intracclular degradation precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin the sequences of cyanoger bromide cleavage, oxidative suphitolysis and related contains. The procedural steps of cyanoger bromide cleavage, oxidative suphitolysis and related procedural contentrations of purification steps can thus be climinated and related contentrations.

The present invention describes an insulin-like growth factor (16F)-1 variant (1), where an amine acid at position 3, 4, 5, 7, 10, 14, 17, 23, 24, 44 or 45, optionally in combination with an amine acid at position 12 and/or 16 of the native summin 1GF1 sequence, is replaced with an alanine, alycine, or a serine residue. The residue at position 7 may be replaced by any amine acid. (1) can have antidabetic, cardiant, oneuroprotective, anorectic, tranquilliser, vulnerary, anorectic, cephrotropic, dermatological, antiHIV and antiviral activities. The IGF-1 mutants are used in any methods where 1GFs or insulin are used, e.g. in treating hyperdycaemia, obesity-related, neurological, cardiac, renal, immunological, and anabolic disorders. These disorders include lung diseases, allomerinicomphitis, interstital nephritis. Turner's syndrome, farous short stature, increased lat mass to-lear ratios, increasing manuodicitoricus virus (HVV), wounds, skin also be selected.

They can also be used for increasing seriam and tisses eivels of biological active 10st or insulin a mammal. The IGF-1 mutants improve the native human pronsulin present masser.

They can also be used for insulin a mammal. The IGF-1 mutants improve the native human pronsulin present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 FVNQHL/CGSHLVEALYL/VYGEKGFFYTPKTHREAEDL/QVGQVELGCCPGAGSL/QPLALEG | 60

                                                                                                                    3
                                                                                                                                        ं
                                                                                                                                                                                                                                                0
                                                                                            The present invention relates to a method for treating cartilage disorders. The method comprises contacting cartilage with an active agent such as insulin-like growth factor (IGF 1) analog with a binding alfinity preference for GF binding protein-3 (IGFBP-3) over IGFBP-1, an IGF-1 analog with a binding affinity preference for IGFBP-1 over IGFBP-3, or a IGFBP displacer peptide that prevents the interaction of IGF with an IGF-B and does not bind to human IGF receptor. The method is useful for IT-reating cartilate disorders (CD), including decementive CD, urticalar CD such as themstoid arthritis and osteoarthitis. The present sequence is human proinsulin, which was used to illustrate the invention.
                                                                                                                                                                                                                                                             Treating cartilage disorders including and ilage damage by injury or degenerative cartilagenous disorders, by contacting cartilage with insuling like growth factor analog with altered affinity for IGF-binding
                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plasmid cloning vehicles - useful for transforming bacterial hosts to produce eukaryotic polypeptide(s).

It is used for the construction of pTrp24. The inventors claim a method for protecting bacteria from phage infection - by transformation with cloning vector cong. seqment with restriction and modification activity. Produ. of plasmid pPR 26 or pPR27 which uses pTrp24; and produ. of plasmid pPR29 which uses a synthetic gene coding for the 32 N-terminal AAS of proinsulin (see ANN40179).

The peptide or polypeptide coding sequence codes for 2-20 AAs, esp. AAS50122-PS0125. The functional polypeptide is esp. growth hormone, human insulin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           replication and on transcription generating polycistronic mrna

The foreign gene may be for human insulin. The lipoprotein gene functional fragment may be the promoter, the 5'-UTR, the 3'-UTR or the transcription termination signal provided that it includes at least the promoter.
                                                                                                                                                                                                                                            Sdec
readily isolated from cell lysates and is stable on washing with urea or detergent solns, at low concns. The granule contains at least 50% of proinsulin and all isolation operations are

The chak fragment ciding for proinsulin was inserted into plasmid vector puttle and diseased with Kpn1 and Hudili. This resulted in the formation of the vector pplns. A fragment encoding amino acids 1-73 of CAI (see AAQ37002) was inserted into pplns to give a plasmid which contained DNA sequences which coded for amino acids 1-73 of CAI and amino acid linker sequence and human proinsulin. This plasmid, p.C.CAT proinsulin, could be used in the formation of insulin analogues which may be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 FVNQHLGGSHLVEALYLV ERGFFYTPKTRKEAEULQVGQVELGGGGPGAGSLQPLALEG

The DNA encoding this sequence was used in the construction of the expression vector of the invention. The coding region of the hpI gene was synthesised and was cloned into the expression plasmid pC2R1265 (see also AAQ38307). Expression of this gene lead to the inclusion of an extra amino acid (Arg) in the second position from the N-terminal of mature hpI. The extra amino acid provides increased expression immunological effects when used in humars. (Updated on 25-MAR-2003 to correct PN lield.)

Where there did Ala pairs have been deleted. A plasmid containing the synthetic prolingulin coding sequence was used to transform kexzmutant yeast strains in the presence of absence of the cloned KEXZ gene. Post translational processing of --insulin into peptides only wecurred in yeast transformed to 8.3. plus. See also AAQ20545. (Updated on 25-MAR-2003 to correct PA 1.eid.)
